

# Consuming Data Through Event Hubs

---

**Warner Chaves**

MS DATA PLATFORM MVP

@warchav sqlturbo.com

# What's in this module?

**Event Hub Fundamentals**

**Creating an Event Hub**

**Pushing Data to an Event Hub**

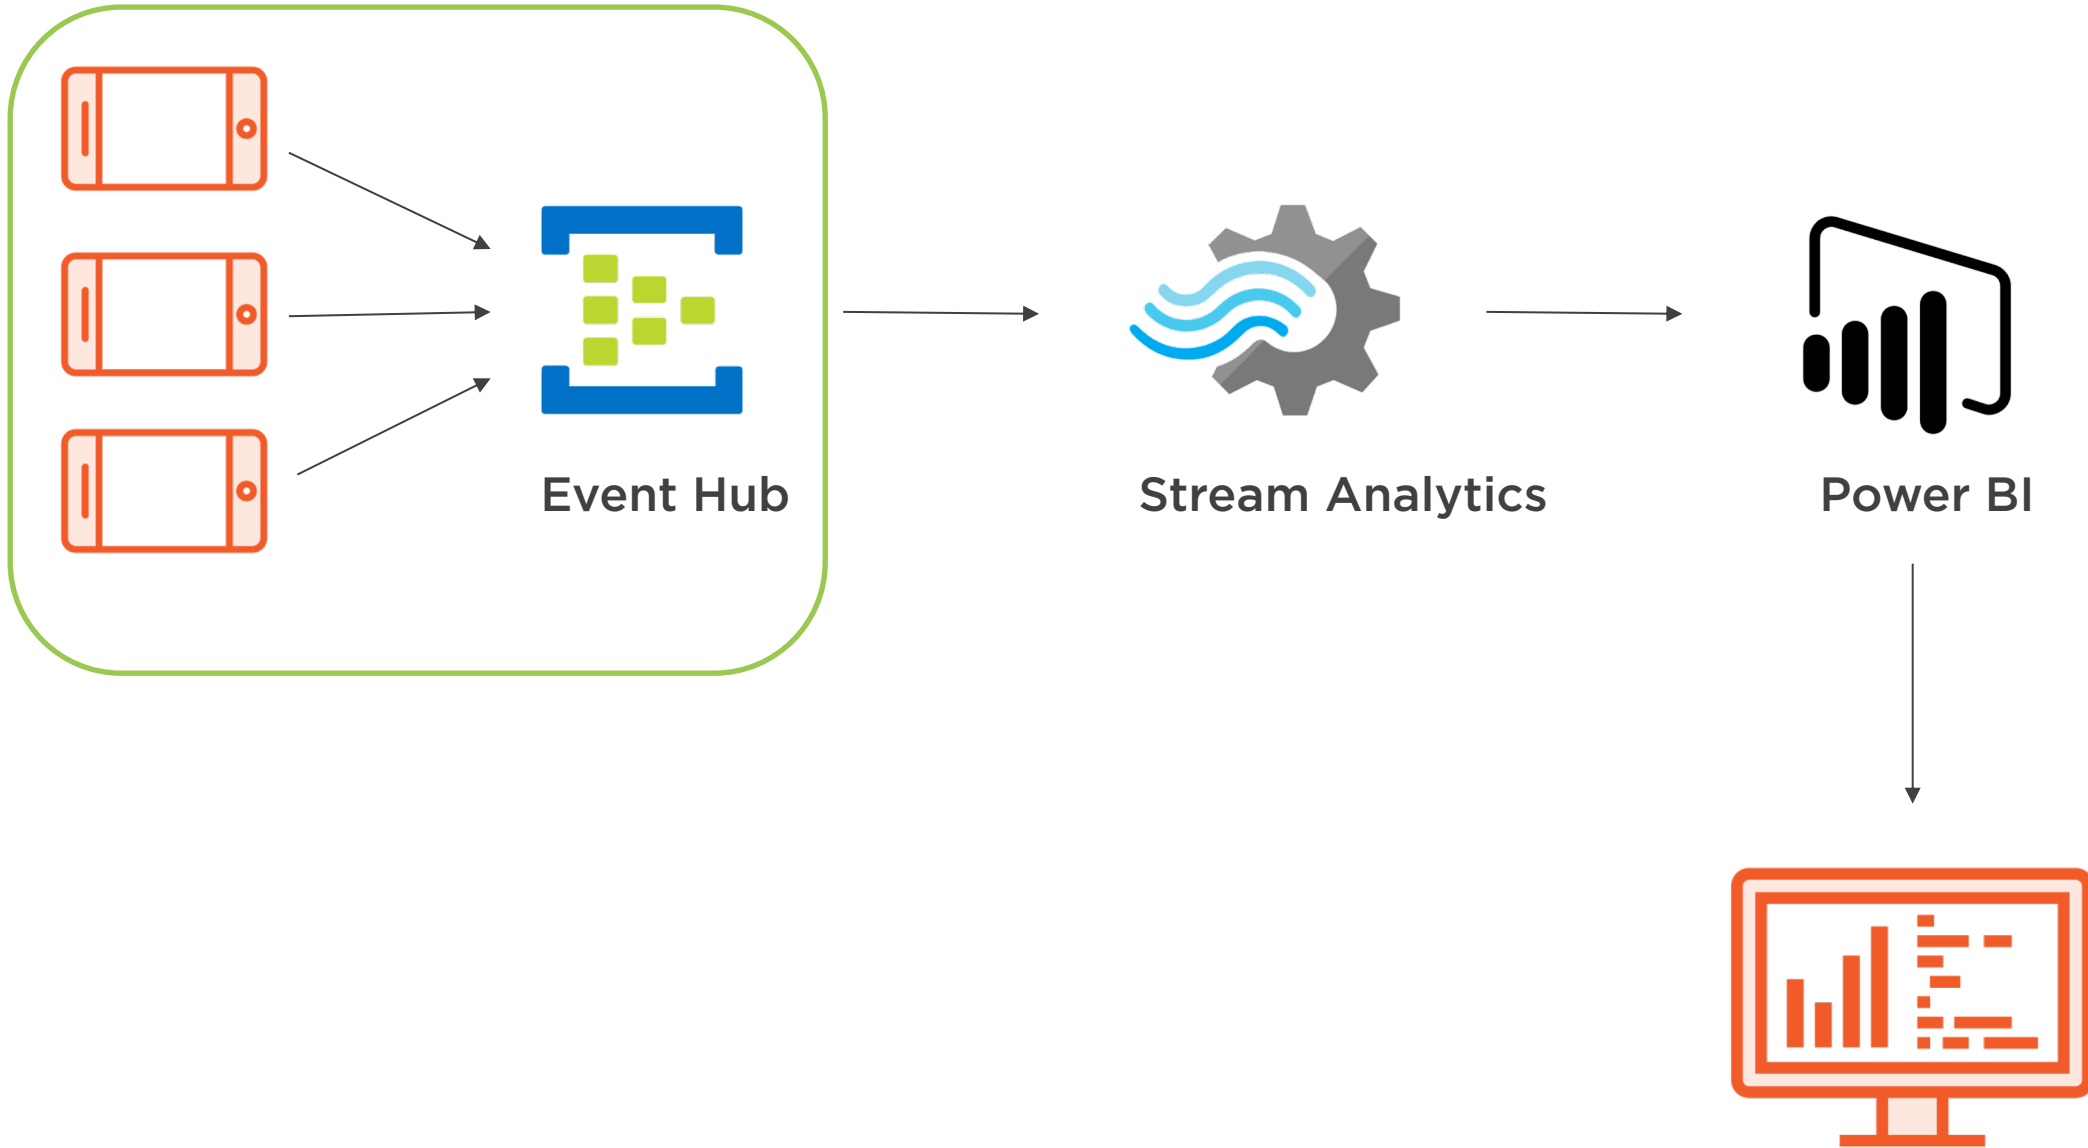

# 1. Azure Event Hubs

The landing pad to Azure

# Why would I use an Event Hub?

# Event Hub Advantages

Flexibility

Scalability

Cost

How do we get started?

# Provisioning Event Hubs

# Throughput Units

TUs are variable reserved capacities assigned to the namespace

A single TU entitles you to 1MB/second or 1000 events/second ingress and 2MB/second or 2000 events/second egress

TUs can be increased up to 20 units

# Auto-Inflate

**Event Hubs can automatically increase your TUs up to a configurable limit.**

Auto-inflate will automatically increase your Throughput Units but it will not automatically decrease them.

# Creating an Event Hub Namespace

**Pick a name**

**Pick a region**

# Creating an Event Hub Namespace

**Pick Throughput Units**

**Enable Auto-Inflate if desired**

# Creating an Event Hub

**Pick a name**

**Pick a partition count**

# Creating an Event Hub

**Set message retention**

**Enable event capture if  
desired**

# Event Hub Partitions

It is a data organization mechanism related to the number of concurrent Hub readers you will have.

# Demo

Creating an Event Hub through the  
Azure portal

# Machinery Temperature Monitoring

We have a warehouse connected to  
Azure

We stream the machines  
temperature readings multiple times  
per second to Azure

# Machinery Temperature Monitoring

**We are going to have 6 machines push their temperature readings twice per second to Azure.**

# Machinery Temperature Monitoring

Windows 10 Virtual Machine

C# program to simulate the  
machines' temperature

The code has dependencies on two packages:  
WindowsAzure.ServiceBus and Newtonsoft.Json

# Demo

Pushing the machine temperature data to  
Event Hubs

## Summary

Event Hubs is an scalable, cost-effective data ingestion service

TUs are assigned to a Namespace that contains the Hubs

Event Hubs provides client libraries for .NET, Java, Node.js and C

At this point in our solution, we have machines successfully pushing data to our Event Hub
